Fittings for Membrane-Covered Sensors

202811/10 — Combination fitting

202811/20 — Flow monitor for disinfection measurands

202811/30 — Individual fitting for membrane-covered sensors

General information

According to data sheets 202630 to 202636 for measurands of water disinfectant and water treatment (e.g. free chlorine and total chlorine, chlorine dioxide, ozone, hydrogen peroxide, and peracetic acid), membrane-covered sensors must have fittings for correct operation and as an option can also be monitored for correct inflow velocity.

Combination fitting (type 202811/10...)

The compact combination fitting can hold several electro-chemical sensors and is typically used for disinfection monitoring of drinking and bathwater as well as slightly polluted process and cooling water. The sensors are easily visible through the fitting's crystal-clear design and can be visually inspected for pollutants.

Flow monitor (type 202811/20...)

The flow monitor monitors the minimum inflow when using membrane-covered sensors and is recommended as an extension to the individual fitting 202811/30...

Individual fitting (type 202811/30...)

The individual fitting is intended to hold an individual membrane-covered sensor. Besides the slot for the sensor, the fitting also has a ground pin to discharge any parasitic currents.

Combination fitting

Brief description

The combination fitting type 202811/10... is intended to hold several electrochemical sensors. Typical use includes disinfection monitoring of drinking and bathwater as well as slightly polluted process and cooling water. With its compact design type, the fitting allows for a space-saving combination of several sensors and is usually used in a bypass or downstream of a tap on the main line. The sensors are easily visible through the fitting's crystal-clear design and can be visually inspected for pollutants.

In the maximum version, 2 sensors with Pg 13.5 thread (e.g. for pH value and Redox), 1 membrane-covered sensor Ø 25 mm for disinfection check (e.g. for free chlorine, chlorine dioxide) as well as a temperature probe with M14 x 1.5 thread. Furthermore, in the measuring water inflow, there is flow monitor according to the floating body principle with an inductive proximity switch. This acts to monitor a sufficient and constant inflow of the membrane-covered sensor. A ground pin can also be installed to discharge any electrostatic charges.

The water flows in and out of the fitting through plug-in connections for hoses with an inner diameter of Ø 6 mm. The flow velocity can be adjusted as required using the needle valve.

Thanks to the adept arrangement of the sensors and flow channels, bubble-free operation of the sensors is virtually possible. The accumulation of air that can lead to distorted measured values is prevented. Unnecessary slots can be blocked before startup by the blanking plugs contained in the scope of delivery.

In order to facilitate sampling for calibration (for free chlorine, for instance), it is possible to extend the combination fitting with a mini ball valve.

Typically, the full set of features for a drinking or bathwater measuring point consists of pH and Redox sensors (Pg 13.5, insertion length 120 mm), membrane-covered sensors for free chlorine, temperature probe, ground pin, and flow monitor.

Flow monitor, temperature probe, and ground pin can be obtained with the fitting when placing the order (see chapter "Order details", page 12) and easily fitted by the user. The electrochemical sensors (e.g. pH, Redox, free chlorine) must be ordered separately.

Areas of application

- Disinfection monitoring of drinking and bathwater
- Monitoring of slightly polluted process and cooling water

Flow monitor for disinfection measurements

Brief description

Membrane-covered sensors for water disinfection (for instance, free chlorine or total chlorine, ozone, chlorine dioxide, etc. - see JUMO data sheets 202630 to 202636) must be operated with a minimum inflow of 15 cm/s. The flow monitor type 202811/20... is integrated in the measuring water supply, in line with the disinfection sensor, and monitors the required minimum inflow to the sensor.

Values measured by the sensors below the minimum inflow speed are too low. This can cause dangerous overdosage or underdosage in a connected regulating system. If values are measured above the minimum inflow speed, the measurement signal is only marginally influenced by the inflow speed.

The flow monitor consists of a flow unit, a needle valve insert for flow control, and an inductive proximity sensor, which is controlled by a float at medium flow. If the minimum inflow speed is reached or exceeded, the float lifts and the contact of the inductive proximity sensor switches. The contact, for instance, can be used to control a binary input for standard signals on the controller, JUMO AQUIS 500 AS. If the inflow is too low, the controller is moved to the "HOLD" status. This helps to avoid incorrect dosages.

Type 202811/20...

Areas of application

- Flow monitoring using sensors for free chlorine, chlorine dioxide, ozone, hydrogen peroxide, or peracetic acid

Application example

- (1) Flow monitor, type 202811/20...
- (2) Membrane-covered sensor, type 20263x/...
- (3) Flow fitting for membrane-covered sensors, type 202811/30..., see chapter "Flow fitting for membrane-covered sensors", page 9
- (4) Fixing bracket made from stainless steel, part no. 00455706

Flow fitting for membrane-covered sensors

Brief description

The flow fitting is intended to hold an individual membrane-covered sensor as described in the data sheets 202630 to 202636. The fitting is generally mounted in the bypass and, thanks to its special design type, provides the correct inflow for the sensor.

The flow monitor type 202811/20....is recommended as an extension for monitoring the minimum inflow speed of a sensor.

The standard ground rod of the fitting enables the discharge of undesired electrical and electrostatic voltage potentials, which occur in complex plants and can distort the measured values.

Scope of application

- Protection fitting for sensors for chlorine, chlorine dioxide, ozone, etc. according to data sheets 202630 to 202636 in the drinking water and bathwater sector and for only slightly polluted process and cooling water

Type 202811/30...
